Summary

I am a Python Developer. I worked on a variety of projects across a wide breadth of domains, spanning finance and mass media to particle physics. My strongest skill is analysis and I enjoy applying it liberally. I am based in Austin, TX, and worked for clients all over the United States. When I was younger, I intended to be a research Physicist. While I have a great passion for physics, I do not share that passion for academia. If you have challenging, meaningful projects that are critical to the success of your business, I'm your man.

SKILLS

Physics:

Astrophysics, Cosmology, Stellar Structure, Stellar Evolution, High energy processes, Plasma Dynamics, General Relativity, Condensed Matter Physics.

Propulsion Systems:

Modeling of variable specific impulse thrusters for the purpose of mission planning and exploration of high energy processes for use in future high energy density propulsion systems.

Modeling of Various Electric Propulsion Systems:

Ion thrusters, Resistojets, parallel and coaxial Pulsed Plasma thrusters, Electromagnetic thrusters, Pulsed Electromagnetic thrusters, Magnetohydrodynamic thrusters

-- Modeling done using Mathematica

Lab Skills:

Analysis of micro-scale optical data from Scanning Electron Microscope, metallurgical analysis with Mössbauer Spectroscopy, experience working with high fluence lasers, soldering, simple circuit analysis, use of oscilloscopes, volt/ohm meters, micro depth polishers, chemical preparation, Polymerase Chain Reaction preparation "from scratch," Polychromide gel electrophoresis, Calibration testing of micropipettes, Organism-specific auger preparation, Experience with handling and disposal of highly acidic and caustic chemicals, low-temperature materials (~70K), electrically active systems, and radioactive materials

Miscellaneous:

Networking, Finance, Patent Law, Securities Law, Software Licensing.

Computer Science/ Programming:

Full-stack Development, Python Development, Python Optimization, Linux Application Development, Database Development and Administration, Server Administration, Algorithms, Pair Programming, Computational Complexity Theory, Data Compression, Encryption, TNO (Trust No One) data storage design, and Data Security.

Programming Languages:

15 years
9 years
8 years
3 years
3 years
1 year
1 year
2 years
<1 year

Computer Hardware:

- I have personally assembled, repaired, and upgraded many computers. I make it a point to assemble servers and workstations that I use "from scratch" as the situation provides.
- Experience with Raspberry Pi and Arduino platforms.
- Digital potentiometers, relays, accelerometers, Digital to Analog conversion, some Oscilloscope usage.
- I have installed network infrastructure and equipment for clients. This includes:

installing wireless Internet systems, configuring routers, running/terminating cable, setting up multiple monitor workstations, building racks and rack-mountable servers, configuring multi-boot systems.

Operating Systems:

Linux, Debian, Ubuntu, Redhat, CentOS, ClearOS, BackTrack Linux, DSL, OS X, OpenBSD, FreeBSD

Databases:

MySQL, PostgreSQL, SQLite, CouchDB, Memcached, Elasticsearch, Solr, AWS Aurora

Web Servers:

Nginx, Lighttpd (compiled and run "from scratch")

System Administration / DevOps:

iptables, OpenVPN, OpenSSL, OpenSSH, ufw, Xen (compiled and run "from scratch" for GPU passthrough), AWS (EC2, ECS, S3, Cloudfront, Route53, Lambda, Aurora), Rackspace, KVM, VirtualBox, Chef, Libcloud, nmap, Wireshark / Ethereal, Metasploit, Bind9, Vagrant, Salt, Puppet

Python Web Frameworks:

Django, Flask, Lektor, Tornado, SQLAlchemy

Other Notable Python Packages:

NetworkX, PyInstaller, PiCloud, PIL / Pillow, argparse, BeautifulSoup, Scapy, NumPy, ctypes, Jupyter, RPi, locust

Version Control:

Git, Mercurial, Subversion -- Bitbucket, Github, JIRA, Review Board

WORK EXPERIENCE

•	Python Consultant 2008 – present
	Led the implementation of advanced technologies, worked with a
	range of clients, facilitated development projects, designed and
	installed server/networking gear, interacted with UI/UX
	designers/design firms, developed projects "from scratch," inherited
	projects midway through development, used modern DevOps tools to
	manage infrastructure, spent a large amount of time researching
	emerging technologies, and written a copious amount of code.

- Worked in Ablative Laser Propulsion lab at UAH ------ 2005 2006
 Studied effects of deflagration vs. detonation in various ablative mediums. Assisted in conducting Schlieren imaging of mediums during laser ablation.

• Senior Research Internship at the University of Alabama at Birmingham ----- Summer 2005

Measured elastic modulus of various micro carbon/glass balloon from composite materials with destructive and nondestructive methods. Studied scanning electron microscope micrograms various samples, some destructively analyzed. Research was funded by Los Alamos National Labs.

PROFESSIONAL PROJECTS

CONSULTATION PROJECT

Client (Silgan) ----- May 2024 - Presant

Led and conducted ERP Disaster Recover assessments for a large multinational manufacturing company with an eye towards defending against ransomware and other malicious attacks targeted at disrupting operations with ERP as an attack vector. Created metrics and methods for conducting the assessment. Lead communications with managers across various sites to assess current status of and level of documentation for Disaster Recovery plans. Generated and edited reports and executive summaries of said assessments for consumption by C-suite executives.

PYTHON CONSULTATION PROJECT

Client (Render Farms) ------ November 2023 - May 2024

Render Farms was an internal project at Terminal Labs to team up with an outside rendering company to provide a front-end web application and backend automation to an existing server farm and client base. The primary service offered was Keyshot rendering for the creation of photorealistic images of 3d models. We automated an existing backend and created an API for communication with the Django frontend web application we created to allow for new users to create and manage rendering jobs where in the past such management would have been done over email.

Technologies used:

Django, Daphne, Nginx, EC2, HTMX, Tailwind CSS, PostgreSQL, Salt

Predikto / Raytheon ------ July 2019 – November 2023

Predikto was a Machine Learning startup that was acquired by United Technologies Corporation (UTC) primarily to provide machine learning enhanced predictive maintenance tools to Pratt and Whitney to aid in the prevention of specific failure modes in certain aircraft engines. During the Predikto acquisition UTC, and Raytheon also merged. Terminal Labs consultants, myself included were brought in to provide stability and aid in knowledge transfer during the acquisition. I initially worked on GraphQL Flask backend for an internal web app used for managing ML workflows. I also helped the team migrate from a home-rolled database migration manager to Alembic. I was later tasked with helping to maintain and mature a particular Python library that was the chief utility used for generating predictive maintenance recommendations for the end client. I eventually became the maintainer of that library and supported data scientists helping to develop and deploy standards that would be used in their projects to help those projects survive into the future.

Technologies used:

Flask, SQLAlchemy, Alembic, Graphene, Marshmallow, Pandas, Sklearn, Scipy, Numpy, Matplotlib, MyPy, Dataiku, SQLite, Pandas, SQL, Kubernetes, Docker

CONSULTATION PROJECT

Kickdrum ----- April 2019 – May 2019

Kickdrum provides technical assessments to firms seeking to acquire companies. Assessments can also involve mergers, in which case the technical viability of leveraging the technology of multiple companies is considered. I provided technical consultation to the client to inform their assessments.

Client (name withheld) ------ February 2019 – April 2019

Client was a small startup looking to build out a prototype for a consumer whitebox product. This included designing an initial rudimentary data model, associated REST API, and a simple media server. Salt states built out to enable hardware provisioning.

Technologies used:

Salt, Salt bootstrap, Rambo, Virtualbox, Flask, SQLAlchemy, SQLAlchemy-media, Flask-Marshmallow, Flask-Restful

PYTHON CONSULTATION PROJECT

Projekt202 ------ August 2018 – February 2019

Projekt202 is a consulting firm with an international presence that specializes in software development, marketing, and business strategy analysis. My partner Mike and I took over one of their client's projects as Sr. Software Architects with a 6-week deadline. We worked to create a project scope that would have the potential to meet business requirements given a tight schedule and be consistent with previous design choices.

Technologies used:

AWS Lambdas, AWS ECS, AWS Aurora w/ Postgres, AWS Cognito, Overall some 50 AWS services, Docker, Flask, SQLAlchemy, Alembic, Elasticsearch, Flask-Marshmallow, Flask-Restful

My involvement included:

- Client had a need to port existing infrastructure to AWS. Large pieces of legacy code were replaced with salvageable elements preserved when prudent.
- A frontend interface redesign was taking place. The effort had to be coordinated with the backend development of an ETL system that also would provide the API for the frontend.
- A system of AWS Lambdas was implemented to process ETL data into a proprietary JSON schema, and further support the ingestion of that JSON

Page 8 of 21

data into a Postgres database using an SQLAlchemy ORM backed schema via a RESTful API hosted by a Flask server.

- Did design work for the backend development and DevOps support of the system described above.
- Planned work for developer sprints.
- Although my role was as a Software Architect, due to the tight timelines involved, I also contributed to backend development.
- Built out the initial iteration of the SQLAlchemy models from the schema that had been designed prior to my arrival on the project. This marked the beginning of the work to rebuild the core backend.
- Designed and built out elements of AWS Cognito middleware to be used for user authentication.
- Ported fundamental elements of a search backend from the legacy product that was based on a collection of case-by-case stored SQL procedures.
- Wrote unit tests and contributed to QA when situationally prudent.

PYTHON CONSULTATION PROJECT

Client (name withheld) ------ May 2018

Client, a consulting firm that needed a quick turnaround for a small project for one of their clients. I built a Webex Teams bot in less than 7 days as was required to hit client deadline.

Technologies used:

Node, Express, npm, Pug, Postgres, Ngrok, Heroku

Cox Media Group ------ June 2014 – July 2016

Cox Media Group, a subsidiary of Atlanta-based Cox Enterprises, is an integrated broadcasting, publishing, and digital media company. The company's operations include 15 broadcast television stations and one local cable channel, 86 radio stations, four metro newspapers, more than a dozen non-daily publications, and more than 100 digital services. At this time, the company operated one of the largest production deployments of Django in the world.

Technologies used:

Python, Django, Django-South, jQuery, Ubuntu, HTML5/CSS3, Git, Virtualenv, Vagrant, Less, Grunt, JIRA, Review Board, BeautifulSoup, JavaScript, jQuery, New Relic, Selenium, Jupyter.

My involvement included:

- Developed for the Medley CMS used by the Austin American Statesman (Austin, TX), the Atlanta Journal and Constitution (Atlanta, GA), the Dayton Daily News (Dayton, OH), and the Palm Beach Post (Palm Beach, FL). The Medley CMS is used by hundreds of content producers and Medley sites are viewed by millions of users across the country.
- Helped successfully achieve launch goals of the JP2 in the Fall of 2014.
- Worked as a Full Stack developer for the Newspaper Teams working on the Janus Redesign Project - JP2; a redesign of medley that was deployed in late 2014
- Working in a large team with dozens of other Python and Web Developers,
 QA Analysts, and Business Representatives
- Worked with the performance team to decrease page load times, page load time perception, and otherwise optimize user experience from a performance perspective. New Relic was used to generate granular metrics and identify specific pain points. We saw a 600% decrease in page load time during our time with this team.
- Helped the Quality Assurance (QA) analysts by picking up some of their workload when backlogged.
- Backported security updates from current Django source to CMG's custom Django fork.
- Discovered and worked to fix a broad spectrum of inconsistencies with the

Page 10 of 21

- existing database schema and Django models.
- Converted PNG/PDF web page design mock-ups files into fully functional interactive HTML5/CSS3/Less/JS based web pages and UI features.
- Provided general code maintenance and refactoring.
- Created new Django HTML templates which were rendered into new customer-facing web pages.
- Worked with client's automatic ad serving systems to rearrange how and where certain ads were included in customer-facing web pages.
- Worked with HTML5/CSS3/Less/JS to make many small improvements to the look and feel of customer-facing web pages.
- Worked with Virtualbox and Vagrant to set up multiple VM guests for testing/development and other various uses.
- Worked with Adobe Analytics tools to add statistics gathering instrumentation to the CMG's online assets.
- Fixed many bugs; fixes ranged from small visual problems to complex backend issues.
- Wrote documentation for internal code and systems as well as additional documentation and usage summaries for third-party products.

NCN Technology ----- March 2014 – May 2014

Advanced Business Software Consulting, LLC dba NCN Technology, is an SBA 8a Certified Business specializing in Information Technology Services for web, mobile, and SharePoint application development projects.

Technologies used:

Python, Scapy, Metasploit, Ubuntu, Virtualenv, JIRA

- Worked as a DoD contractor on a US Air Force project to create security vetting tools for iPhone apps.
- Wrote a MITM proxy to inspect encrypted iPhone traffic over WiFi.
- Wrote scripts to look for XML injection, SQL injection, shell injection, and vulnerabilities in iPhone app source code.

Modavanti ----- March 2013 – June 2014

Modavanti, A New York based E-commerce company that sells sustainable fashion from around the world. They bring an element of environmental and social awareness to the runway. In 2018 Modavanti was acquired by DoneGood.

Technologies used:

Python, Django, Django-South, jQuery, Rackspace, Elasticsearch, Ubuntu, Chef, HTML5/CSS3, Git, Mercurial, Virtualenv, Gearman, SimpleJSON, authorize.net, Fabric, Memcached, curl, supervisor.

- Reworked how product images are downloaded from the Rackspace CDN.
- Worked with Elasticsearch to enhance how customers search for products.
- Worked with Rackspace's API to their CDN in order to batch-upload image files.
- Worked with the Python Gearman client to create worker scripts that were deployed to the background worker server.
- Revised the project documentation to better describe how to perform a full-stack restart/cloud infrastructure transfer.
- Worked with Virtualbox to set up multiple VM guests for testing/development and other various uses.
- Supported the client's cloud infrastructure both the production VMs and the staging VM.
- Maintained the Supervisord configuration that controlled the Gearman background worker processes.
- Worked with autherize.net Python API to create Modavanti virtual currency
- Worked with UPS Python API
- Used Chef to deploy worker servers.

mobiusmed.com ------June 2013 – December 2013

Mobius Medical Systems offers innovative software for modern radiation oncology. Specifically, they offer products that help Medical Physicists analyze radiation treatment plans for accuracy. Intensity-modulated radiation therapy allows for radiation to more selectively target cancer cells. However, plan error tends to increase with modulation. To fully leverage modulation plan error must be controlled as much as possible. In 2018 Mobius was acquired by Varian Medical Systems.

Technologies used:

Python, CouchDB, PyCUDA, NumPy, Flask, Genshi, Foundation, jQuery, Coffee-Script, couchdb-python, HTML5/CSS3, Selenium, PhantomJS, Git, couchable, Virtualenv, VMware, Xen.

- Worked with CouchDB to create new MapReduce views to distill data.
- The client wanted to be able to access Nvidia GPU cards from a virtual machine. I set up VMware, ESX, ESXi, VSphere, and Xen for a round of experiments to configure VT-d based PCI passthrough.
- Ported an algorithm originally written in NumPy to C, to be called in Python via ctypes to aid in hitting performance benchmarks.
- Refactored code to reduce memory usage redundancy in NumPy array objects.
- Added in product features by working with Python Flask views, Genshi templates, and HTML5/Javascript.
- Worked with PhantomJS to reconfigure the DPI resolution of exported PDF files.
- Made many aesthetic and UI interactivity changes to the project code.
- Worked with Selenium to create a Python module that could be used to run UI tests against the HTML5 interface.
- Refactored aspects of how data is stored and retrieved to/from CouchDB.
- Moved and created python functions that forked off as child processes to run in the background.
- Created a forked process monitoring module that gathers performance statistics (including memory usage, cpu-time, wall-time) of each child process and stores this data into CouchDB.

- Wrote unit tests using the unittest Python module and Selenium for several product features.
- Built a dedicated GPU server
- Created Flask views to accommodate one-off Photon and Electron dosage absorption.

agyield.com ----- January 2012 – March 2013

agyield.com offers a very useful tool for risk management for farmers that allows them to understand the costs and risks related to their crops in order to keep track of and project profit scenarios.

Technologies used:

Python, Django, AWS, MySQL, Ubuntu, Mercurial.

- Collaborated with the CEO and CTO of the company that offers the agyield.com service to understand and revise the development roadmap.
- Performed a broad review of the client's technical operations.
- Worked with AWS to help maintain the client's production servers.
- Studied commodities trading and crop insurance.
- Worked with the client's ETL systems that regularly downloaded and processed data purchased from a third party.
- Modified how and when emails were programmatically sent.
- Interpreted various properties of features, options, and crop insurance types to correct algorithms that calculated ROI.
- Optimized and refactored crop insurance calculation functions in Python.
- Ran a security audit on their stack.

SIDE PROJECTS

OPEN SOURCE PROJECT

terminallabs.com ------ 2011 - Present

terminallabs.com is our own company website. Through it, we have taken the opportunity to use several technologies. Though we have a fairly simple website, the body of work that supports our website continually evolves. As much as our time allows, we habitually use this to experiment with new technologies and methodologies, while striving to maintain ease of maintainability. Currently, our website is using the Lektor as a CMS, Framework, and Static Site Generator.

The work is open source and can be found here: https://github.com/terminal-labs/tl_web

Technologies used:

Python, Django, Mezzanine, Flask, Lektor, AWS (EC2, S3, CloudFront, Route53), DigitalOcean, Vagrant, Salt Stack, Jira, Bitbucket, Git, Mercurial, Postgres, Debian, Buildbot, Jinja, Less, jQuery

- Iteratively developing the frontend codebase working with HTML5/JS/LessCSS and Django or Jinja templates
- Iteratively developing the Python server backend with Django / Mezzanine / Flask. This included creating models changes, views, and modifying the CMS for altering content in admin.
- Using Lektor as a web framework and static site generator and hosting this static site over AWS S3 & Cloudfront with SSL.
- Maintaining multiple code repositories in Mercurial and Git.
- Creating a repository that heavily uses Vagrant and Salt Stack to create and manage both development and production environments on either AWS or DigitalOcean. With a simple `vagrant up` with a couple of optional arguments you can spin up local or cloud-based dev instances or cloud-based production instances.
- Used locust with selenium to do load testing against our deployment.

OPEN SOURCE PROJECT

Inflation ------ 2017 - Present

Inflation is a tool that allows you to simply orchestrate and provision a cluster. It is built on top of **Rambo** (listed below). With Inflation, you can with a couple of commands create a variable number of virtual machines. This cluster can either be local on a powerful enough computer or created with cloud-based virtual machines such as Digital Ocean Droplets or AWS EC2 instances. The cluster is easily configured to have subsets of VMs created and provisioned differently for specialized purposes, so subsets may have varying hardware and configured with different software, all networked together for powerful parallel computing.

The work is open source and can be found here: https://github.com/terminal-labs/inflation

Technologies used:

Python 2 & 3, Bash, DigitalOcean, Vagrant, Rambo, VirtualBox, SaltStack, Hadoop, HDFS, Ambari, Spark, Dask, Pandas, Jupyter, Distributed, Docker, Ubuntu, Yarn.

- Created virtual machines on DigitalOcean & VirtualBox.
- Configured inflation to install Hadoop with Hortonworks Ambari.
- Configured inflation to install Hadoop HDFS.
- Wrote Jupyter notebooks that ran on a Hadoop Edge Node to distribute data storage and computation, using Anaconda Dask and Distributed, Pandas, and Hadoop HDFS.
- Used Jupyter's Magic to use HDFS to import data and in situ configuration of Edge Nodes.
- Imported ~100 GB of data from a Digital Ocean Volume onto HDFS and processed it with Python.
- Cycled clusters repeatedly.
- Created a 64-node Hadoop cluster, and a 120-node general cluster.

OPEN SOURCE PROJECT

Rambo ------- 2015 - Present

Rambo is a tool that allows you to simply provision new virtual machines on any provider and have them be nearly identical. To accomplish this Rambo makes heavy use of Vagrant and its various plugins for different providers. As a design philosophy, we really want to have development environments that are as similar as possible to production environments. This streamlines development, catches bugs, and helps smooth production releases. So to achieve this, we wanted to automate the provisioning of these environments. For this we used SaltStack. Among other things, SaltStack is great for provisioning machines. With it, we can provision a local or remote instance pretty easily.

The work is open source and can be found here: https://github.com/terminal-labs/rambo

Technologies used:

Python, Bash, AWS EC2, DigitalOcean, Vagrant, VirtualBox, LXC, Docker, SaltStack, Jira, Bitbucket, Git, Mercurial, Postgres, Debian, Salt Cloud

- Worked with numerous Vagrant plugins each from different developers and organizations with different design philosophies.
- Created virtual machines on AWS EC2, DigitalOcean, VirtualBox, & LXC
- Worked with complex SSH key vendor and authentication systems.
- Maintaining multiple code repositories in Mercurial and Git.
- Smoothed out many inconsistencies between several different cloud providers.
- Created SaltStack configurations with over 50 salt states and custom grains.
- Worked with LXC on Ubuntu 16.04.
- Wrote documentation and tested against its instructions.
- Research to investigate replacement of Vagrant dependencies with Salt Cloud.

OPEN SOURCE PROJECT

Terminal Labs IRC Server ------ 2011 - Present

I set up and deployed the in-house Terminal Labs IRC server and bouncer. I compiled ratbox IRC and configured it to use our wildcard cert for validated SSL only operation. I also deployed ZNC bouncer to use alongside it (also using validated SSL.)

Technologies used:

AWS, EC2, Bind9, Route 53, Ubuntu, gcc, openssl, ircd-ratbox, ZNC

OPEN SOURCE PROJECT

Digital Potentiometer Demo ----- March 2017

A simple demonstration for introducing others to the use of the Raspberry Pi's GPIO pins. The project involved writing Python to control a digital potentiometer that modulated the voltage on a LED; effectively a digitally controlled light dimmer. GPIO pins are used to power the chip and the voltage supply for the potentiometer wiper. It is also used to send serial instructions to the potentiometer. I also soldered together an oscilloscope from a kit and used it to study the output from the potentiometer. I presented my work to the North Austin Gadget Hackers group in April of 2017. I have since added support for the Pi-Plates relay board and used this project to give demonstrations to school children.

The work is open source and can be found here: https://bitbucket.org/smitty42/you-do-drone-on/src

Technologies used:

Python, Bash, RPi, Raspbian, Raspberry Pi, MCP4131 chip, Pi-Plates relay board, Voltmeter, oscilloscope

PYTHON DEMONSTRATION PROJECT

Developed PiCloud/iPhone pi distribution statistics app ---- April 2013 – March 2013

This nice iOS app is a simple demonstration of calling the PiCloud cluster via an iPhone app. From the app, the user can search for an inputted string in several billion digits of the decimal expansion of Pi. In 2013 PiCloud was acquired by Dropbox.

Technologies used:

Ubuntu Server, Apache Cordova, PiCloud, Flot Chart, OS X, Xcode, Python Tornado, Nginx, HTML5/CSS3, jQuery, Mercurial.

- Developed a functional backend server in Python Tornado for receiving/processing AJAX data sent from the iPhone app.
- Studied and worked with PiCloud and their API in order to become proficient with their environment.
- Configured an Nginx server to support the "mockup viewer".
- For this project we needed to test on physical iOS devices, so I used multiple developer tools from the Apple ecosystem (iOS provisioning portal, app signing, physical device deployment)
- Wrote backend code to compute statistics on substring distribution.

EDUCATION

2005 - 2008

Studied Physics and Astrophysics at the University of Alabama in Huntsville Bachelors of Science program. My Senior research project was a theoretical model for Neutron star cores that attempts to account for their super nuclear density.

PATENTS ISSUED

- High Specific Impulse Superfluid and Nanotube Propulsion Device, System and Propulsion Method.
 - Patent 8,991,150. 31 Mar. 2015.
- Web Insulation System, Valve for a Web Insulation System, and a Storage Container Using the Web Insulation System.
 - Patent 8,991,636. 31 Mar. 2015.
- Apparatus and Method for Anonymously Presenting Targeted Advertisements and Desirable Media Content in Association with a Virtual Currency.
 - Patent 9,001,979. 7 Apr. 2015.
- Web insulation system, valve for a web insulation system, and a storage container using the web insulation system (continuation).
 - o Patent 9,279,540. 8 Mar. 2016.

AWARDS AND ACCOMPLISHMENTS

- Member of the American Institute of Aeronautics and Astronautics (AIAA)
 Nuclear & Future Flight Propulsion Technical Committee (NFFPTC)
- Member of Alpha Lambda Delta honor society
- Participant in UAH honors program
- UAH Zahn Research Scholar
- Participant in NASA Athena Student Interns Program
- Member of NASA's Mars Student Teacher Advisory Panel
- College of Science Dean's List 2007
- College of Engineering Dean's List 2008
- Recipient of Zahn scholarship for physics 2005, 2006
- Recipient of UAH Presidential Scholarship 2005-2009

ORGANIZATIONS THAT I BELONG TO

American Institute of Aeronautics and Astronautics

Programs & Tools That I Have Experience With

Software Programs:

- AutoCAD
- **Emacs**
- **GIMP**
- Mathcad
- Mathematica

Misc Tools:

- 7-Zip
- Clonezilla
- Genshi
- Jinja
- Git
- Mercurial
- Subversion
- **GParted**
- Grunt
- jQuery
- Lastpass
- Less
- Phantom|S
- Virtualenv
- Locust
- Selenium
- Gearman
- SpinRite
- TrueCrypt
- Unix Utils (ssh, rsync, awk, grep, ...)
- Conda
- Miniconda

Amazon Web Services (AWS):

- S3
- EC2
- AWS CLI
- Route 53
- CloudFront
- Certificate Manager

Python Frameworks and Python Tools

- BeautifulSoup
- Django
- Django-CMS
- Flask
- Lektor
- Jinja2
- Jupyter
- Lazythumbs
- Mezzanine
- PiCloud
- PIL
- PyInstaller
- PySide
- SQLAlchemy
- Pandas
- Sklearn
- Scipy
- Matplotlib

Operating Systems:

- Apple OS X
- CentOS
- ClearOS
- Damn Small Linux
- Debian
- Fedora
- FreeBSD
- Linux Mint
- Ubuntu

Web Apps:

- Bitbucket
- Github
- Google Drive / Docs
- Pivotal Tracker
- Redmine

Database Systems:

- CouchDB
- Elasticsearch
- Memcached
- MySQL
- PostgreSQL
- **SQLite**

Servers:

- Lamp
- Lighttpd
- **Nginx**

Compilers:

- F95
- g95
- GCC
- Shed Skin

DevOps:

- Fabric
- OpenVPN
- SaltStack
- Vagrant
- VirtualBox
- **VMWare**
- Xen
- **Puppet**
- Docker
- Kubernetes

Platforms and Analytics:

- Adobe Analytics
- Adobe DTM
- New Relic
- Omniture
- Rackspace Digital Ocean
- Dataiku
